Introduction

This document helps you to implement the feature of authorized signatory in the Invoices for all the verticals of SRSL. The authorized signature of the Invoice in the earlier version of the Apollo application is a scanned copy of the signature of an authorized person. As this is not a digitally verified signature, the signature is prone to duplication.

Overview

This document covers the following on the enhancement in the Apollo application:

- Scope of the document
- Purpose of change
- Procedure to use the digitalized signature
- System validations

Audience

The document facilitates the users of Apollo within an organization to generate an invoice with the digital signature of the authorized person in the organization.

Purpose of change

The signature used in the invoices of the existing Apollo application is not effective as it can be easily modified by any other user. The signature is not digitally verified that is, the system does not cross-check the signature with the authorized signature registered in the application. The Apollo requires an authenticated signature. Thus, the digital signature is introduced in the application.

Procedure

When the application generates an Invoice, the system assigns a Token Number to that invoice such that the Invoice is digitally verified. The government understands that the signature is verified by an authorized person and cannot be duplicated. The signature is free from malpractices.

The steps involved to digitalize the authorized signature in Invoice for all the verticals of SRS entity are:

1. Click **Signature Properties** on **Signature Validation Status** dialog box.

Figure 1: Signature Validation Status

2. Include the signature in **Signed By** field and click **Validate Signature**.

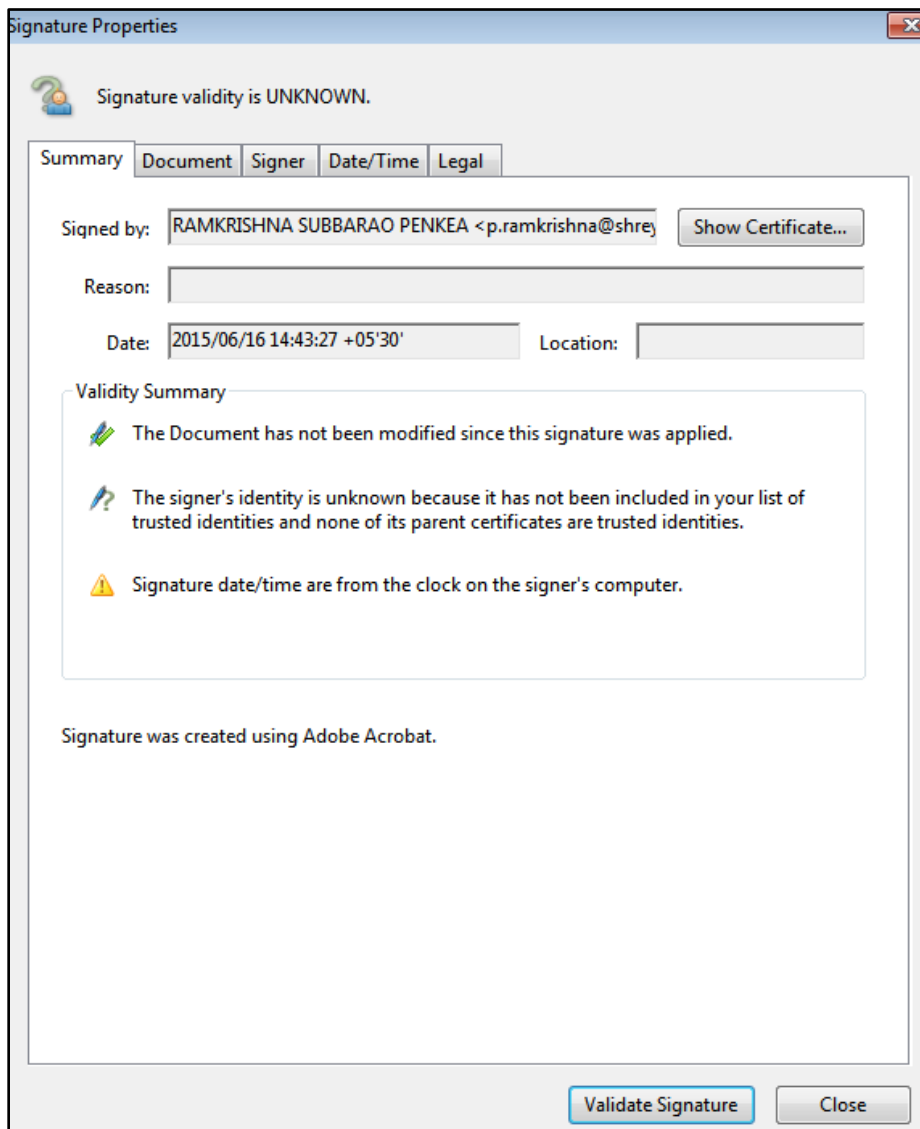

Figure 2: Signature Properties

3. On the Certificate Viewer screen, click **Add to Trusted Identities** in **Trust** tab.

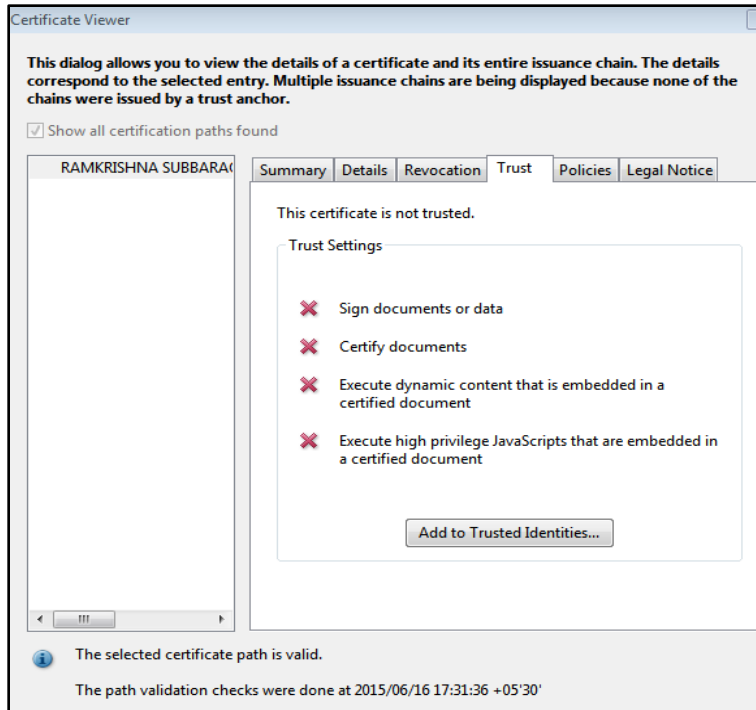

Figure 3: Certificate Viewer

4. Enable all the check boxes and click **OK**.

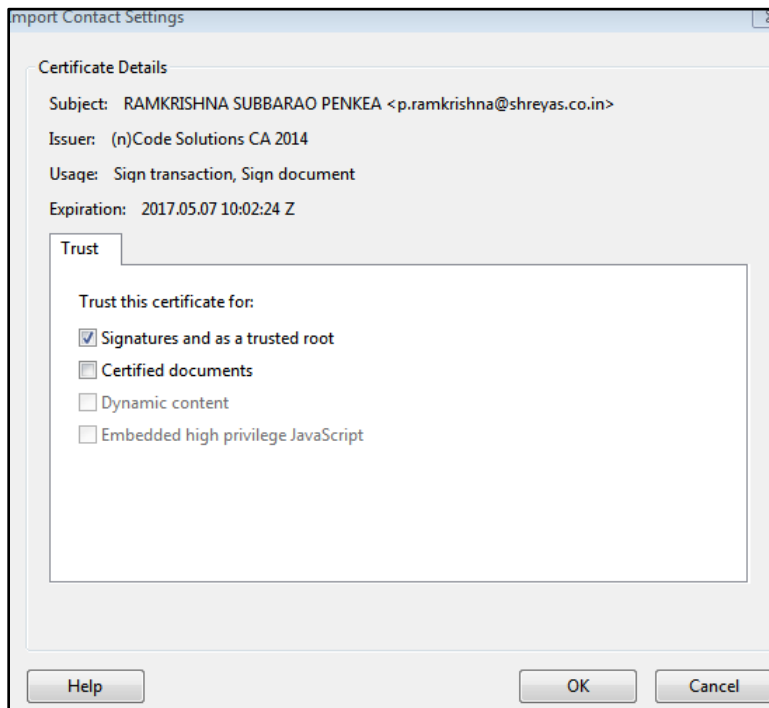

Figure 4: Import Contact Settings

Advantages

The advantages of digitalizing the authorized signatory are:

- The signature cannot be duplicated.
- You can avoid mismatch errors.
- The signature is free from malpractices as a digital copy of signature cannot be copied or modified.

System validations

The system must perform the following validations with respect to Invoice:

- The system must validate the signature only when the user generates an Invoice on the first instance.
- The system must generate only one Token Number per Invoice.

Summary

The Invoices of the application are efficient with the usage of digital Signature of the authorized person.
