

6. Attach Documents

An attachment is a file sent along with a request that consists of extra information relevant to the task or the request. An attachment can be a document, a picture, an audio, or a video file. In the present business trends, a feature to allow presenting some additional information is a valid requirement and one of the most needed functionality in any business process automation.

You can attach a file in three different ways:

- **Drag and Drop:** Open the source and target windows side by side; drag the file that you want to attach by holding the mouse pointer from the source window and drop it on to the target window by releasing the mouse pointer.
- **From a local drive:** Browse the location of the file that you want to attach from the local drive of your computer.
- **Cloud storage services:** Select a file from various cloud storage services such as Google Drive, Box, Dropbox, OneDrive, and so on.
- **Arbitrary Links:** Select a file from the web such as any valid URL pointing to a file.

Use Case 1- For Google Apps Customers

Select Google Drive as the default file storage location. When you attach a file, it will store in Google Drive and only the link to the file is stored and shared in KiSSFLOW process. Read permission is set automatically to the attached file and shared to all the workflow participants. You can open and see the file when it comes for your approval.

KiSSFLOW administrator can only configure the attachment settings. An administrator can define the settings in Admin > Settings > Application Preferences.

User has to request the file owner for edit permission.

1. User Types And Privileges

KiSSFLOW categorizes its users (people who work on the application) into three groups according to the access permissions. The administrator provides the access permissions to each user based on the role they perform. They are:

User

KiSSFLOW users can do the following activities:

- Use the workflows created by the creators.
- Initiate requests and track the progress of requests.
- Approve requests, provide inputs, and follow the requests they participate in.
- View reports and dashboard to analyze and gather insights about their requests.

Creator

KiSSFLOW creator can do the following activities:

- Create and implement the workflows using the 5-Step process creation wizard.
- Collaborate with other creators or process owners and maintain the workflows.
- Manage access to the workflows by configuring permissions as to who can initiate the processes.
- Create and maintain Masters in KiSSFLOW (Masters are used for master data management).
- Share reports with other users.

Creator is also a User and has all the privileges of a user.

20. Export A Report

- Create and implement the workflows using the 5-step process creation wizard.
- Collaborate with other creators or process owners and maintain the workflows.
- Manage access to the workflows by configuring permissions as to who can initiate the processes.
- Create and maintain Masters in KiSSFLOW (Masters are used for master data management).
- Share reports with other users.

Creator is also a User and has all the privileges of a user.

Administrator

KiSSFLOW administrators can do the following activities:

- Manage user access to KiSSFLOW by approving or rejecting access requests.
- Activate and Deactivate Users
- Configure access level for user and creator.
- Select a theme for the company's KiSSFLOW account.
- Set the locale information and couple of preferences to enable/disable default email notifications.
- Create and maintain Masters in KiSSFLOW.
- Share reports with other users.
- Process administration.

An Administrator is also a Creator & a User by default and has all their privileges.
