1 Velocix Analytics

The advanced video streaming analytics of Velocix provide the insight needed for more effective operations, engineering planning, and business strategy. Operating across your CDN, origin, recording and advertising applications, this cloud-based solution visualizes the key performance metrics using customizable dashboards and reports based on Time Range, POP, Organisation and other filters. Velocix Analytics enables streaming efficiency to be optimized. It accurately measures Quality of Service (QoS) and Quality of Experience (QoE), and helps the stakeholders monitor and troubleshoot issues within the system. Historical data on the metrics helps in planning and expansion. It also provides detailed subscriber viewing data to guide marketing strategy.

Velocix Analytics collects data from various sources and creates a centralized log repository used to generate meaningful metrics.

1.1 Scope

Velocix Analytics is a one-stop solution for providing analytics information for all products offered by Velocix. However, the focus of this version of the document is restricted to CDN and Origin metrics.

ATTENTION: The Velocix Analytics has released a few versions now and has been rolling out enhancements in phases. The images in this document depict the functionality of a feature and the UI elements might have a slight variation from the latest version since the product is evolving. For instance, the VXAA 3.0 release has an option to choose the product as CDN or Origin, which might not be present in the images of the UI released in the previous versions. Login to the VXAA application to view the latest UI components as per the current release.

1.2 Recommended browsers

Unified Management Console (UMC) and Velocix Analytics work best with the latest (non-beta) versions of browsers such as Google Chrome, Mozilla Firefox, Microsoft Edge, and Safari.

Use the latest version of the browsers for increased security and a better experience. If you update your browser to a new version and experience display or rendering problems, please report these to your CDN Administrator (for example, support@velocix.com) to investigate compatibility issues.

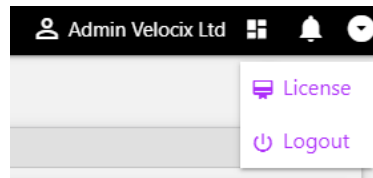

1.3 Logging in and Logging out

You can access the Velocix Analytics portal in any of the following ways:

- *Accessing Velocix Analytics from Unified Management Console (UMC)*
- *Logging in to Velocix Analytics*

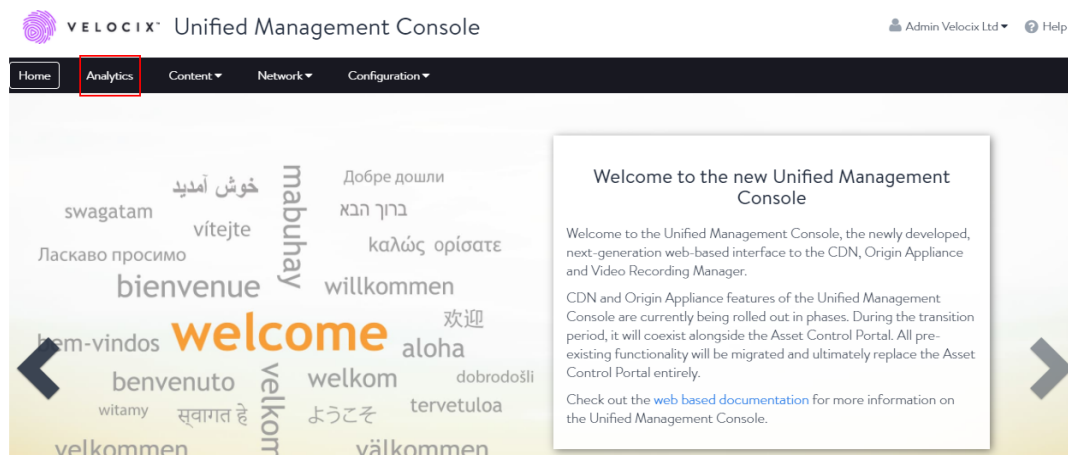

To log out from Velocix Analytics portal, click **Logout** option in the top right dropdown of

the application.

1.3.1 Accessing Velocix Analytics from Unified Management Console (UMC)

The address to access UMC (also known as Console2) is of the format `https://console2.<CDN domain name>`. Provide your credentials and login to UMC. Click the **Analytics** tab which opens the Velocix Analytics Portal in a new browser tab. This option will be available when the Console2 server is configured with the `clctl`s for `vx-analytics`. Contact your operator if this option is not available on your Console2. UMC session will be used to validate the user for Vx Analytics portal.

The feature availability and access rights in the UMC and Velocix Analytics Portal depend on your account type and role.

Note: You can access the Analytics portal directly. See *Logging in to Velocix Analytics* section.

1.3.2 Logging in to Velocix Analytics

The address to access the Velocix Analytics Portal is of the format `https://ui.analytics.velocix.com/`. Enter your valid credentials on the login page. After logging in, you will see the Real-time Monitoring Dashboard for CDN.

1.4 User Roles and Permissions

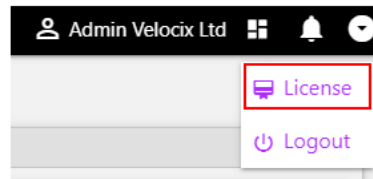

The user roles and access capabilities are based on those created in the Console2 application. They are dependent on the organization hierarchy of the Customer environment. See *Users and Organizations* section of the **CDN Configuration Management Guide**.

1.5 License Configuration

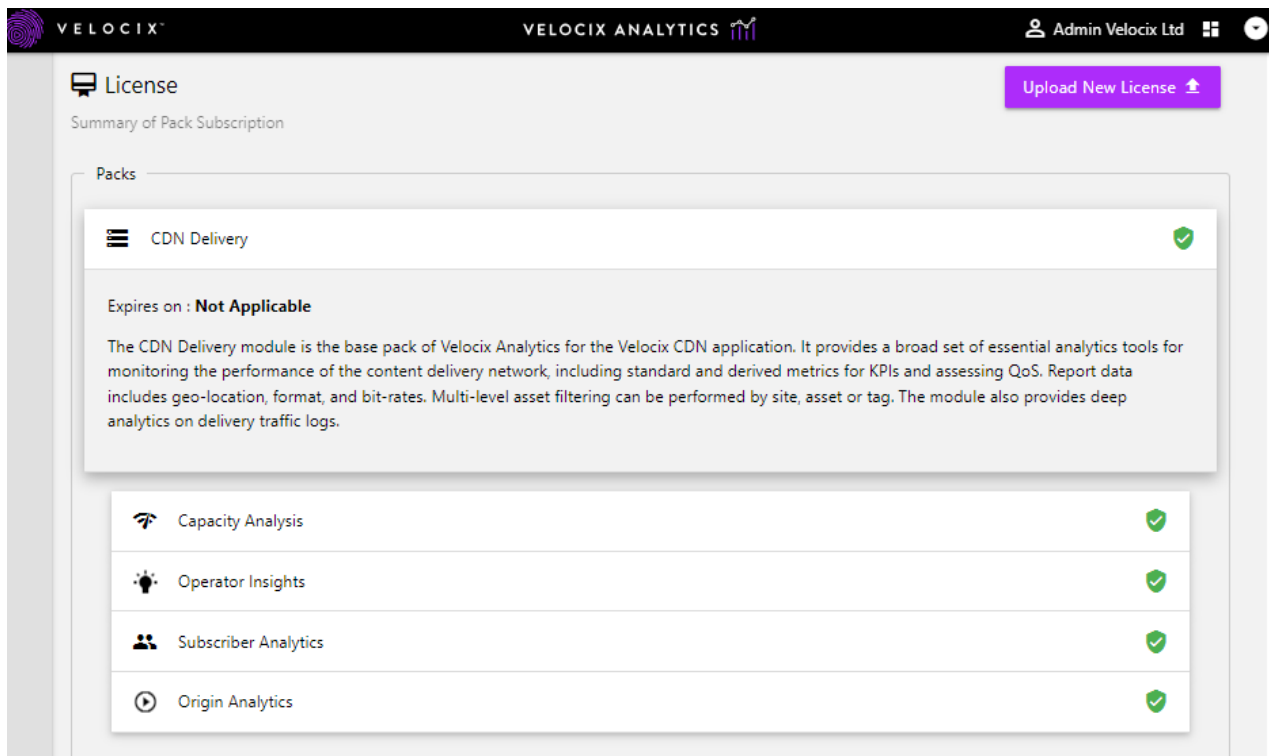

License page displays the summary of the licenses installed and the packs subscribed by the customer along with the expiry information.

Follow the steps below to upload a new license to Velocix Analytics:

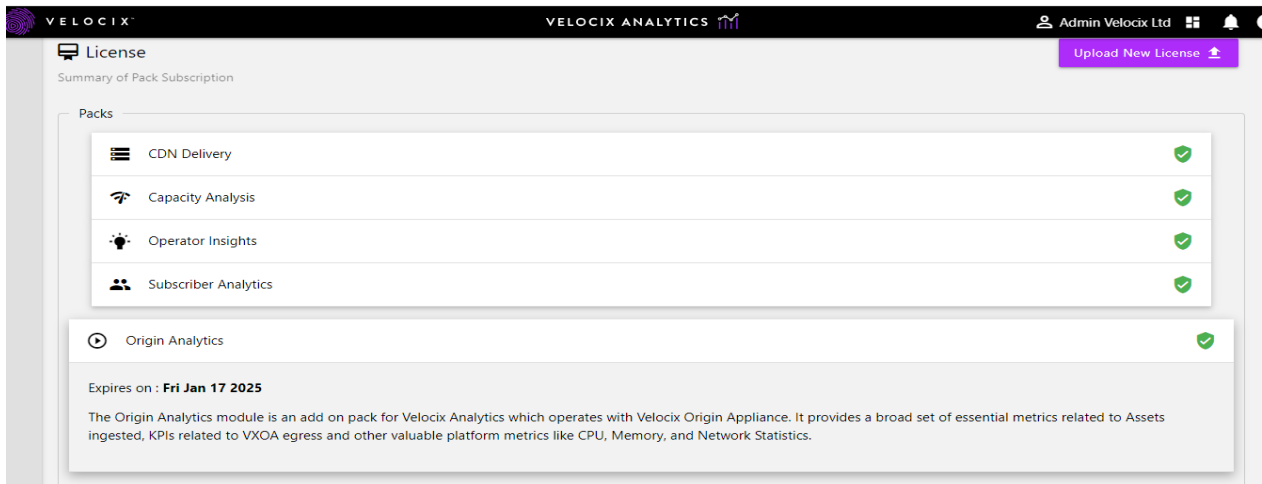

1. Click the dropdown on the right corner of screen and choose the option as **License**.

2. Click **Upload New License** received from Velocix. CDN Delivery is the base pack of Velocix Analytics.

Origin Analytics module is an add on pack that operates with Velocix Origin Appliance. Contact the Velocix Sales Team for more details.

3. Browse to upload a valid license in JSON format.

2 Getting started with Velocix Analytics

Note that, only the packs opted by you for each product will be accessible on the menu.

2.1 User Interface Layout and Features

Velocix Analytics has a user-friendly design with metrics for both CDN and Origin solutions. The landing page displays real time data for metrics which updates every 5 seconds. The dashboard displays pre-configured metrics from each pack. Click the Velocix logo to view the landing page from any screen.

On the top-right corner of the screen, you will find icons for:

- **Custom Dashboards** - see *Managing Custom Dashboards* section
- **Triggered Alerts** - see *Alerts* section
- **Language** - To customize the language, contact the Velocix Sales Team
- **License** - To view the license information, see *License Configuration* section
- **Logout** - To log out from the session and redirects to the login page

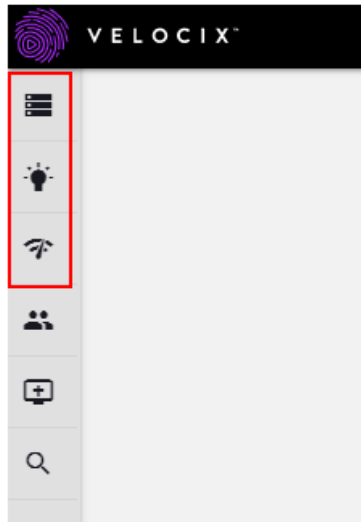

You can hover on the icons to see the tooltip of each option. For example:

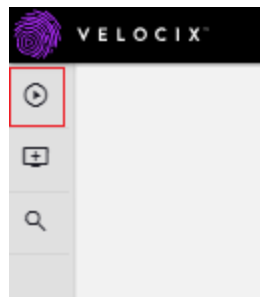

Select the product on the landing page as CDN or Origin.

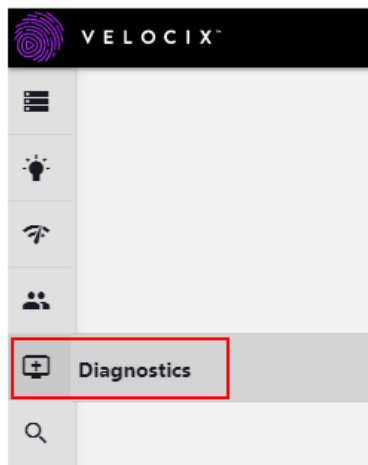

On CDN tab, hover the icons on the left navigation bar to access the respective CDN analytics packs.

On Origin tab, hover the icon on the left navigation bar to access the Origin analytics pack.

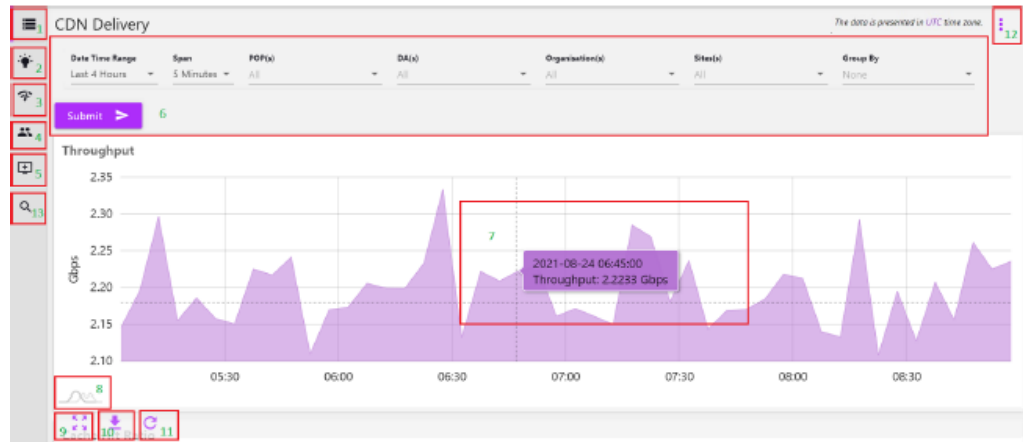

To view diagnostics, hover the icon shown in the image below:

2.2 Dashboard Capabilities and Chart Options

Following are few features of the dashboards. The callouts in the screenshot are followed with a corresponding explanation.

- **1** - CDN Delivery
- **2** - Operator Insights
- **3** - Capacity Analysis
- **4** - Subscriber Analytics
- **5** - Diagnostics
- **6** - Filters are pre-configured depending on the relevant data and the dashboard may vary for each pack. For more information, see *Dashboard Filters*. When you click **Submit** after selecting the options in the filters, the dashboard loads with data meeting the criteria of the selected parameters. If you want to see the data for the set parameters for a particular chart, do not click **Submit**. Instead use the **Reload** option for the chart.
- **7** - Information on a particular data point on the chart can be viewed by hovering on it. You may want to investigate a certain time period to get a clearer view of the plotted data. Click and drag over the time period you want to magnify on the time axis. This focuses the chart on that time period but does not alter the time resolution of the chart. This is applicable only for time series charts. To return to the original magnification, click the zoom out icon.
- **8** - Indicates the chart is created using amCharts library. The watermark will not be shown if you use the licensed version.
- **9** - Zoom in to the chart for a closer view of data. Click close icon on top left to exit zoom.
- **10** - Download the chart as a CSV file
- **11** - Reload the chart after applying filters or to refresh the specific chart
- **12** - Dashboards allow you to:
 - **Print** - print current status of the dashboard data as a PNG image
 - **Clone** - copy the dashboard. This feature is useful when you want the same configurations for another dashboard with minor differences. See *Cloning a Dashboard*
 - **Schedule PDF** - schedule the dashboard to be delivered as PDF

- **13** - Search - To execute simple SQL queries on the tables that are available for you based on the packs enabled. Click on a *Table Name* to view its schema.

Note: If information icon ⓘ is available on certain dashboards, click to view the overview of the dashboard and the interpretation specifics of the data visualization of that page.

ATTENTION: Vx Analytics uses Word cloud (or tag cloud, or weighted list) chart which is a visual representation of DA names where the font size shows the percentage of memory **Available** or **Used** for that DA compared to other DAs as shown in the figure below.

3 Change history
